Abstract

A recording medium is provided, which records a program executable on a computer connected to a printer which conducts printing by use of a consumable item,

5 wherein, the program allows the computer to execute, a receiving process which receives from a user an input of a country/region where the printer is used, a storing process which stores a URL being associated with the country/region in the input thus received,

10 with reference to data where the country/region and the URL are associated with each other in advance, and an obtaining process which obtains information regarding a consumption degree of the consumable item used in the printer, and an accessing process which

15 accesses a Web site where the consumable item is purchasable, the Web site being identified by the URL thus stored, when the consumption degree meets a standard which is obtained by a predetermined rule. With the recording medium as described above, it is

20 possible to achieve a commonality in a program which executes a process for accessing the Web page where a consumable item is purchasable according to a degree of consumption of the consumable item, irrespective of a country/region for distributing the program.
